## **Bore Clamps**

ROEMHELD

HILMA = STARK

Cartridge type, without centring function, double acting, for bore diameter 7.8-17.7 mm, max.operating pressure 250 bar

The required form-fit in the bore hole is obtained

by the special profile of the hardened clamping

bushings with penetrating points in the bore hole

wall. Hardened materials cannot be clamped

The workpiece is put directly onto the bore

clamp and will not be deformed during clamping.

Since clamping is effected within the bore, the

remaining surfaces are free for machining on 5

The size of the possible machining forces is certainly limited using this type of clamping, espe-

Except the static friction force between the workpiece and the support, the bore clamp cannot compensate any side loads. Additional stops

additionally supported or clamped in a flexible

cially crosswise to the clamping surface.

Application

with these elements.

sides (see application example).

face

cations.

(floating) position.

See page 4.

**Functional description** 

#### **Advantages**

- Axial clamping in simple bore holes
- 5-sided machining possible
- Expand clamping bushing with spring force
- Hold workpiece without hydraulic pressure
- Clamp workpiece with adjustable hydraulics
- Hardened workpiece support
- Pneumatic seat check
- Connection for positive air pressure protection
- Standard FKM seals
- 2 sizes available

The bore clamp is a double-acting pull-type

radially expanded with spring force by a pyramid-shaped clamping bolt. Thus the expansion force is always the same and independent of the hydraulic clamping pressure.

means of the expanded clamping bushing.

ing of the clamping bushing are hydraulically controlled.

Connecting the positive air pressure protection, the clamping bushing is protected against swarf and coolants.

#### Important notes

against too high side loads during insertion or machining by suitable stops or centring bolts.

The required penetration depth of the toothing depends on the strength of the material for the form-fit toothing with the workpiece. Therefore hardened or coated workpieces cannot be used. The tapering of the bore hole should not exceed 3°. In case of doubt we recommend a clamping test.

Clean the support surface and blast clean the clamping bushing before every clamping cycle. If swarf fall into an open clamping bore, blast air must be continuously switched on.

Clamping bushings and wiper should be exchanged after 100,000 operations. Part numbers for complete clamping sets: see chart on page 3.

Operating conditions, tolerances and other data see data sheet A 0.100.

### **Pull-down force**

\* Consider the tolerance of the bore hole

\*\* For operating pressures < 100 bar please contact us.

Hydraulic connection

# 

#### Workpiece clamping

 Put the workpiece onto the hardened support surfaces and position by external stops or pins, if required.

**Functional description** 

- 2. Start the clamping process by switching the valves.
- 3. With pressure relief of the unclamping port the clamping bushings will be radially expanded very quickly. According to the material, the toothing penetrates more or less deeply into the bore hole wall and a form fit will be obtained.
- 4. In case of pressure increase at the clamping port, the hydraulic piston pulls the expanded clamping bushing and thereby also the workpiece onto the support surface.

#### Workpiece unclamping

- 1. For unclamping a minimum pressure of 100 bar is required. In case of pressure increase at the unclamping port, the hydraulic piston returns to its off-position and the spring tension of the clamping bushing will be released. Very light workpieces can be slightly lifted.
- 2. Remove the workpiece.

#### Note:

For operating pressures < 100 bar please contact us.

#### Clamping bushing only expansion

# What happens in case of pressure drop of the clamping pressure?

In case of pressure drop the workpieces is no longer pulled onto the hardened support surface. The radial expansion of the clamping jaws and thereby the form fit with the workpiece are maintained by the spring tension.

# What happens in case of pressure drop of the unclamping pressure?

The clamping bushing is expanded by spring force and can only be released with the minimum unclamping pressure of 100 bar. If there is no oil pressure the workpiece can neither be taken out nor a new workpiece can be inserted.
