

Electric Swing Clamps

Parallel drive, position and clamping force monitoring, IO-Link connection optional
 DC voltage 24 V, minimum energy demand

Application

Electric swing clamps are used for clamping or holding of workpieces

- when the clamping and holding points shall be free for loading and unloading of the fixture
- when an extended functionality is required for automated systems
- when clamping elements have to be controlled individually
- where the clamping force must be maintained also after the separation from the energy supply

Thus electric swing clamps are particularly suited for:

- Packaging industry
- Test systems
- Special machines
- Assembly equipments and robotics
- Automatic manufacturing systems
- Clamping fixtures with workpiece loading via handling systems

Description

The electric swing clamp is driven by a wear-resistant brushless DC motor. The motor speed is transformed by means of a gear and a threaded spindle into the swing and stroke movement of the piston rod. For swinging the clamping arm by 180°, an axial stroke of only 3 mm is required. If the clamping arm collides during the swing motion with a workpiece, the mechanism is protected against overload. The direct current motor is automatically and immediately switched off. When unclamping, the clamping arm always swings back to the off-position.

Integrated control

The electronic control for the DC motor is on a board in the housing of the electric swing clamp.

Electric connection

Power supply and signal exchange for external control are transmitted by two short cables with plug-type connector. Cable sockets are available for the customer's connection (see connection accessories).

Safe touch voltage

The used DC voltage 24 V is considered to be a "low voltage" and thus it is not dangerous for people in case of contact.

Advantages

- High clamping force
- Adjustable clamping force
- Clamping force monitoring
- Can be controlled individually or in common
- High operating safety by self-locking spindle drive
- Mechanical reclamping by Belleville springs
- Swing angle up to 180° available
- Overload protection device in the case of collisions with the clamping arm
- Electric position monitoring and extensive self-monitoring with diagnostic options
- Clamping stroke control possible
- Low voltage 24 V
- Leakage free
- Maintenance free (500,000 cycles).
- Code class IP 67

Power supply

For motor and electronic control a DC voltage of 24 V with a residual ripple of max. 10 % is required.

For the DC motor, we recommend the use of a switching power supply with a current output of 15 A per connected electric swing clamp. When operating several swing clamps at the same time, the line is to be enlarged correspondingly. The electronic control has to be supplied by a separate power supply (24 V DC / 100 mA).

Adjusting ranges

After removal of the protection cover, the following adjustments can be made on the control board:

- Clamping force
- Swing speed
- Compensation of the clamping arm elasticity

The clamping force can also be adjusted via analogue input.

Important notes!

Electric swing clamps are designed exclusively for clamping or holding of workpieces in industrial applications. They can generate very high clamping forces. The workpiece, the fixture or the machine must be in the position to compensate these forces.

In the effective area of piston rod and clamping arm, there is the danger of crushing.

The manufacturer of the fixture or the machine is obliged to provide effective protection devices. During loading and unloading of the fixture and during clamping a collision with the clamping arm has to be avoided.

For the positioning of workpieces, the admissible displacement force as per diagram on page 3 has to be considered.

If there is any danger that fluids penetrate into the electric swing clamp, the screw plug at the venting port G 1/8 has to be removed and a vent hose has to be connected. The other end of the hose has to be placed to an absolutely dry area. It is recommended to connect a dry positive air pressure protection with 0.2 bar.

Functional principle

Function control

Unclamped

- Clamping arm in off-position and unclamping process completed

Clamped

- Clamping arm within clamping area and clamping force obtained
- Clamping stroke control possible by output signal

Diagnostic options

- Extensive review on error conditions
- Signalling via error code (flashing signal) internally on control board or via external interface signal
- Error messages can be reset
- Review display after 500,000 cycles

You will find a complete description in the supplied operating manual.

Use IO-Link

Universal · Smart · Easy

Optionally with cable and 4-pin connector for connection to an IO-Link master. Via this interface, commands and information are exchanged between the electric swing clamp and a higher-level control.

Advantages

- Reduced cabling effort
- Simplified commissioning
- More extensive diagnostic options
- Interference immunity through digital signal transmission
- All settings can be made conveniently via the IO-Link interface

Technical information

Further information on the application and operating conditions is available on request.

Important note!

To guarantee a process-safe application, all technical requirements and general conditions must be carefully checked. Please contact our technical consultants (on site or directly in product management, Tel.: (+49 6405 89456).

Effective clamping force F_{Sp} as a function of the clamping arm length L

The effective clamping force is smaller the longer the clamping arm. For longer clamping arms, the clamping force must be reduced so that the admissible bending moment will not be exceeded. The adjustment of the clamping force is made on the control board or externally via the analogue input L.

The default setting of 6.9 kN is suitable for the accessory clamping arm $L = 75$ mm.

Example

Accessory clamping arm 0354 003: $L = 75$ mm

As per diagram:

- max. clamping force 6.9 kN
- min. clamping force 2.5 kN

The clamping force is continuously adjustable.

Admissible displacement force F_v for the horizontal positioning of a workpiece

The electric swing clamp can push, i.e. position a workpiece against fixed points.

The usable displacement force F_v is depending on the clamping arm length between 0.7 and 1.1 kN.

Conditions:

For functional reasons, the clamping force F_{Sp} must be adjusted for the subsequent clamping of the workpiece with the accessory clamping arm ($L = 75$ mm) to at least 4.5 kN.

Example

Accessory clamping arm 0354 003: $L = 75$ mm

As per diagram:

- Min. clamping force 4.5 kN
- Max. clamping force 6.9 kN
- Displacement force F_v 1.0 kN

With a friction coefficient $\mu = 0.4$, this is sufficient for a workpiece mass m :

$$m = \frac{F_v}{g \cdot \mu} = \frac{1000 \text{ N}}{9.81 \cdot 0.4} = 250 \text{ kg}$$

Horizontal mounting position

The electric swing clamp can be operated with the accessory clamping arm 0354003 (e = 75 mm) in every mounting position.

In the case of longer and heavier special clamping arms, the admissible radial torque M1 of 0.4 Nm will be exceeded, which can lead to malfunctions and increased wear.

Remedy:
Provide the clamping arm with a counterweight as explained in the opposite example.

Clamping arm S1 with weight compensation S2

Required counterweight m2 = $\frac{M1}{l2}$ [kg]

M1 = First-order torque around the piston axis (control of the CAD model) [kgm]

m2 = Mass of counterweight [kg]

l2 = Centre of gravity of the mass m2 [m]

Important note!

The additional counterweight increases the moment of inertia J around the piston axis, what can be easily determined by querying of the CAD model. To avoid an overload of the swing drive, the flow rate has to be reduced: The setting is described in the operating manual.

Mounting position - horizontal
